

ABSTRACT OF THE INVENTION

The invention provides protective garments that comprise a liquid impermeable garment body having an inner surface with first and second portions, an absorptive device associated with the first portion of the garment body, and fibers affixed to at least a part of the inner surface of the second portion of the garment body. The protective garment may further comprise a connector, and tubing. The tubing can be used for absorbing or draining fluids away from a person's body, or for transmitting fluids to a person's body.
